

Mobius TTS Office Software

With Mobius TTS in your vehicles and office, you have the ability to identify information that *YOU* consider important to solve key business issues. Mobius TTS delivers a comprehensive office package that meets *YOUR* exact needs!

Improving operational efficiency

- Usage patterns of tractors and trailers identify potential to increase equipment utilization.
- Route information notes deviations in actual versus planned trip performance. Data collected is used to update routing standards and generate more efficient routes so drivers accomplish more.
- Every second of every driver's day is monitored. Needless delays such as yard time, out-of-route miles, and excessive time spent at stops are eliminated; productivity continues to increase day-by-day, driver-by-driver.
- Cost analysis is generated by customer, by route, by driver, or by unit – any way you ask for it! You get what you need for sound decision making.

Meeting safety needs and compliance requirements

- Detailed, accurate trip records of the driver's time on the job give a reliable picture of driving habits and facilitate improvement in driver and vehicle performance. Drivers are kept informed and alert with Cadec's driver-specific coaching system so that they maintain safe vehicle handling practices.

Using wireless communication, you have a real-time information system that works the way *YOU* want. . . *YOU* pre-define important events so you and your driver can be alerted as they occur!

Locating your vehicles when you need to

- The Mobius TTS electronic tachograph in combination with Global Positioning Satellite locations enables automatic vehicle location. You can electronically locate your vehicles to see who is available for a last minute back haul.

Defining what you want, when you want it

- Everything that happens on a vehicle is recorded as an event. You pre-select events that will trigger information automatically back to the office – to you or to anyone – anywhere within your organization!

- DOT logs are graphically generated onboard for review by both the driver and the office. Driver available hours are calculated automatically to ensure DOT compliance under any rule. Drivers are warned of impending DOT violations before they occur.
- With automated state fuel tax reporting, you eliminate significant clerical effort and gain accurate information for state fuel tax audits.
- In the event of an incident on the road, you have a complete breadcrumb trail – details of what actually happened, second-by-second.

Integrating everything into your enterprise system

- A graphical history of every trip for every vehicle is in your database. Once you decide which data is vital to your purposes, it can be easily shared by any or many of your departments for smooth coordination of all business functions.
- Total detailed vehicle history enables improved maintenance and reduces vehicle down time.
- Yes, benefits accrue company wide – from payroll to billing to inventory control – everywhere!

Staying connected to your mobile work force

- Do you want to know when a driver has arrived at one of your best accounts with damaged goods? Or be alerted when someone is behind schedule?
- You can depend on your driver having accurate information before he gets to his next stop and having that vital information available to you.
